1 Introduction

This model policy provides guidance to all those involved in care provision and should be adopted, with local variations as agreed, for infection prevention and control practices and procedures.

The policy aims to:

- Embed the importance of infection prevention and control into everyday practice
- Reduce variation in infection prevention and control practice and standardise care processes
- Improve the application of knowledge and skills in infection prevention and control
- Help reduce the risk of Healthcare Associated Infection (HCAI) particularly cross-infection/contamination
- Help align practice, monitoring, quality improvement and scrutiny

The practice recommendations set out are drawn as far as possible from appraisals of the available professional literature on infection prevention and control, conducted by colleagues at Health Protection Scotland which can be found via the link to the Health Protection Scotland (HPS) web site on:

1.3 Scope
This policy does not address laboratory safety or laboratory waste disposal.

This document may be used in conjunction with existing specialist guidance in some settings e.g. decontamination in dental practice: HTM 01 – 05.

This document does not include Viral Haemorrhagic Fevers or Middle East Respiratory Syndrome – Coronavirus (MERS-CoV). Guidance for these can be accessed via the WHAIP “Compendium of Guidance” document. Other diseases/agents may emerge that are out of scope of for this document.

1.4 Variations
All local variations to the national model policy must be agreed and approved by the Infection Prevention and Control Committee or organisational equivalent. See Appendix 10
1.5 Acknowledgement
This work is based, in part, on the National Infection Control Manual developed by HPS. Public Health Wales is grateful for permission to reproduce the content with amendments for use in Wales.

2 Responsibilities

Organisations must ensure that:

- systems and resources are in place to facilitate implementation and compliance monitoring with infection prevention and control amongst all staff, including all agency or external contractors

Managers of all services must ensure that staff:

- are aware of and have access to infection prevention and control policy documents
- have had instruction/education on the elements of infection prevention and control
- have adequate support and resources available to implement, monitor and take corrective action to ensure compliance with infection prevention and control
- with health concerns or who have had an occupational exposure, are referred to the relevant agency e.g., General Practitioner or Occupational Health
- undertaking Exposure Prone Procedures (EPP) have undergone the required health checks/clearance; and

Staff providing care must ensure that they:

- understand and apply the principles of infection prevention and control;
- understand their responsibility for their own practice
- maintain competence, skills and knowledge in infection prevention and control through attendance at education events and/or completion of online training modules
- communicate the infection prevention and control practices to be taken by colleagues, those being cared for, relatives and visitors without breaching confidentiality;
- have up to date occupational immunisations/health checks/clearances requirements as appropriate;
- are responsible for including infection prevention and control as an objective in their Personal Development Plans (or equivalent)
- report to line managers and document any deficits in knowledge, resources, equipment and facilities or incidents that may result in transmission of infection; and
• do not provide direct care while at risk of potentially transmitting infectious agents to others. If in any doubt they must consult with their line manager, Occupational Health Department or Infection Prevention and Control Team (IPCT)

Infection Prevention and Control Teams (IPCTs) must:

• engage with staff to develop systems and processes that lead to sustainable and reliable improvements in relation to the application of infection prevention and control
• provide expert advice on the application of infection prevention and control in the care setting and on individual risk assessments as required

3 Transmission Based Precautions (TBPs) Policy

3.1 Introduction
Standard Infection Control Precautions (SICPs) may be insufficient to prevent cross transmission of specific infectious agents. Therefore additional precautions (TBPs) are required to be used by staff. SICPs must still apply with these additional considerations.

In particular: Hand Hygiene as per the WHO ‘Your 5 Moments for Hand Hygiene’ is an essential part of TBPs as with all care activities (see SICPs policy).

The principles of TBPs apply in all care settings.

TBPs should be applied when caring for:
• Patients\(^1\) with symptoms of infection;
• asymptomatic patients who are suspected or incubating an infection; or
• patients colonised with a pathogenic infectious agent e.g. MRSA.

TBPs are categorised by the route of transmission of infectious agents/diseases (some infectious agents can be transmitted by more than one route):

• **Contact** precautions: Used to prevent and control infections that spread via direct contact with the patient’s skin/mucous membranes or indirectly from the patient’s immediate care environment (including care equipment). This is the most common route of cross-infection transmission.
• **Droplet** precautions: Used to prevent and control infections spread over short distances (less than 3 feet (1 metre)) via droplets (>5μm) from the respiratory tract of one individual directly onto a mucosal surface or conjunctivae of another individual. Droplets penetrate the respiratory system to above the alveolar level.

• **Airborne** precautions: Used to prevent and control infections spread without necessarily having close patient contact via aerosols (<5μm) from the respiratory tract of one individual directly onto a mucosal surface or conjunctivae of another individual. Aerosols penetrate the respiratory system to the alveolar level.

1 The use of the word ‘Persons’ can be used instead of ‘Patient’ when using this document in non-hospital settings

### 3.2 Patient Placement/Assessment for Infection Risk

Patients must be promptly assessed for infection risks on arrival at the care area and if possible, prior to accepting a patient from another care area.

The clinical judgement and expertise of the staff involved in a patient’s management and the Infection Prevention and Control Team (IPCT) should be sought particularly for patient placement decisions such as isolation prioritisation when single rooms are in short supply.

Patient assessment factors that increase the potential risk of cross-infection transmission are:

• The patients presenting symptoms e.g. a productive cough, rash, vomiting and/or diarrhoea, and pyrexia (fever).

**Patients who should be prioritised for immediate isolation** in single rooms preferably with en-suite facilities include those:

• With a history of admission to hospital (in the last 12 months) in another country (outside the UK)
  o In particular, a history of admission in a country or UK region with a known high prevalence of Carbapenemase Producing Enterobacteriaceae (CPE)
• Known to have previously been positive for (CPE) (or a confirmed contact)
• Presenting with symptoms of diarrhoea and/or vomiting for which an infectious cause cannot be definitively excluded
• Known or suspected to have an infectious agent that is transmitted via the airborne route (see Appendix 8)

**All patient placement decisions and assessment of infection risk must be clearly documented in the patient notes.**
For patients with a suspected/known infectious agent Appendix 8 provides details of the route of transmission, optimal patient placement, duration of isolation and type of precautions required.

Patient/Staff cohorting

If multiple patient cases of the same infection are confirmed or if single rooms are unavailable, cohorting of patients may be appropriate. Patients should be separated by at least 3 feet (1m) if cohorted.

Consider assigning a dedicated team of care staff to care for patients in isolation/cohort rooms/areas as an additional infection control measure (staff cohorting). This can only be implemented if there are sufficient levels of staff available (so as not to have a negative impact on non-affected patients’ care).

Rooms with controlled ventilation

Rooms with controlled ventilation will be available in some facilities. These rooms are designed to prevent transmission of infection via the airborne route; from the room occupant to others outside the room. Where these facilities exist they must be prioritised for patients with infectious agents spread by the airborne route. Rooms suitable for airborne precautions will either be at negative pressure to the surrounding space or will be of a positive pressure lobby design (see Health Building Note 4, Supplement 1: Isolation facilities in acute settings – Wales).

Rooms designed to protect the occupant from infection by preventing ingress of air from outside the room via positive pressure are not suitable for Transmission Based Precautions.

Duration of isolation/cohort

Patient(s) should remain in isolation/cohort with the door closed whilst they remain symptomatic and/or are considered infectious.

Before discontinuing isolation; individual patient case risk factors should be considered (e.g. there may be prolonged shedding of certain microorganisms in immunocompromised patients); and the clinical judgement of those involved in the patients management should be sought.

Avoid unnecessary movement of patients between care areas.
3.3 Management of Patient Care Equipment in an Isolation/Cohort Area

- Use single-use items if possible.
- Reusable non-invasive communal equipment should be dedicated to the isolation/cohort area and decontaminated prior to use on another patient.
- An increased frequency of decontamination should be considered for reusable non-invasive communal equipment when used in isolation/cohort areas.

*For how to decontaminate non-invasive reusable patient care equipment see Appendix 5*

3.4 Control of the Environment

**Environmental decontamination**

Patient isolation/cohort rooms/area must be decontaminated at least daily using either:

- a combined detergent/disinfectant solution at a dilution of 1,000 parts per million available chlorine$^2$ (ppm available chlorine (av.cl.)); or
- a general purpose neutral detergent in a solution of warm water followed by disinfection (1,000ppm av.cl.$^2$)

Other decontamination technologies such as Hydrogen Peroxide Vapour (HPV) or Ultra Violet (UV) may be in use and should be agreed locally and documented at Appendix 9

Increased frequency of decontamination should be incorporated into the environmental decontamination schedules for areas where there may be higher environmental contamination rates e.g.:

- toilets/commodes particularly if patients have diarrhoea; and
- “frequently touched” surfaces such as door/toilet handles and locker tops, over bed tables and bed rails.

Environmental decontamination equipment must be single-use, colour coded as per policy, dedicated to the affected area or decontaminated e.g. mop and bucket.

Waste (managed as hazardous waste) and used linen (managed as infectious linen) must be bagged before removal from the isolation room/cohort area.

*2. Other disinfectant products may be agreed by local variation (appendix 9)*
Terminal environmental decontamination

Following patient transfer, discharge, or once the patient is no longer considered infectious:

Remove from the isolation/cohort area:
- all healthcare waste and any other disposable items (bagged before removal from the room);
- bedding, screens/curtains and manage as infectious linen (bagged before removal from the room); and
- patient care equipment (decontaminated in the room prior to removal).

The room should be decontaminated using either:

- a combined detergent disinfectant solution at a dilution (1,000ppm av.cl.\(^2\)); or
- a general purpose neutral detergent clean in a solution of warm water followed by disinfection (1,000ppm av.cl.)\(^2\)

The room must be cleaned from the highest to lowest point and from the least to most contaminated point. Manufacturers’ guidance and recommended product “contact time” must be followed for all cleaning/disinfection solutions.

3.5 Personal Protective Equipment (PPE)

In addition to SICPs, when contact or droplet precautions are required (including when in combination with airborne precautions) single-use gloves and aprons must be worn for all care and cleaning activities in the patient room/cohort area.

Hand Hygiene must be performed before and after donning and removing PPE

Gloves must be:

- changed immediately after each patient and/or following completion of a procedure or task;
- changed if a perforation or puncture is suspected; and
- appropriate for use, fit for purpose and well fitting to avoid excessive sweating and interference with dexterity.

Aprons must be:

- changed between patients and/or following completion of a procedure or task

Respiratory Protective Equipment (RPE) and facial protection must be:
considered when a patient is admitted with a known/suspected infectious agent/disease spread wholly or partly by the airborne or droplet route and when carrying out aerosol generating procedures (AGPs).

2. other disinfectant products may be agreed by local variation (appendix 9)

For guidance on when Respiratory Protective Equipment (RPE) and facial protection should be worn see Appendix 7

All tight fitting RPE i.e. FFP3 respirators must be:

- fit tested on all healthcare staff that may be required to wear a respirator to ensure an adequate seal/fit according to the manufacturers’ guidance.
- fit checked (according to the manufacturers’ guidance) every time a respirator is donned to ensure an adequate seal has been achieved.
- compatible with other facial protection used i.e. protective eyewear so that this does not interfere with the seal of the respiratory protection. Regular corrective spectacles are not adequate eye protection.
- donned and removed in a safe area (e.g. outside the isolation/cohort room/area.

Further information regarding fitting and fit checking of respirators can be found on the Health and Safety Executive at: http://www.dh.gov.uk/en/Publicationsandstatistics/Publications/PublicationsPolicyAndGuidance/DH_110792

Powered respirator hoods are an alternative to tight-fitting FFP3 respirators for example when fit testing cannot be achieved.

FFP3 respirator or powered respirator hood must be:
- considered for use by visitors if there has been no previous exposure to the infected person or infectious agent; but
- never worn by an infectious patient(s) due to the nature of the respirator filtration of incoming air not expelled air.
4. Glossary:

**Abrasion** – A graze. A minor wound in which the surface of the skin or a mucous membrane has been worn away by rubbing or scraping.

**Aerosols** – See Airborne Particles.

**Aerosol Generating Procedures (AGPs)** – Certain medical and patient care activities that can result in the release of airborne particles (aerosols). AGPs can create a risk of airborne transmission of infections that are usually only spread by droplet transmission.

**Airborne particles (aerosols)** – Very small particles that may contain infectious agents. They can remain in the air for long periods of time and can be carried over long distances by air currents. Airborne particles can be released when a person coughs or sneezes, and during aerosol generating procedures (AGPs).

**Airborne (aerosol) transmission** – The spread of infection from one person to another by airborne particles (aerosols) containing infectious agents.

**Alcohol based hand rub (ABHR)** – A gel, foam or liquid containing alcohol that is rubbed into the hands as an alternative to washing hands with soap and water.

**Alert organism** – An organism that is identified as being potentially significant for infection prevention and control practices. Examples of alert organisms include Meticillin Resistant *Staphylococcus aureus* (MRSA), *Clostridium difficile* (C.diff) and Group A *Streptococcus*.

**Antimicrobial** – An agent that kills microorganisms, or prevents them from growing. Antibiotics and disinfectants are antimicrobial agents.

**Asymptomatic** – Not showing any symptoms of disease but where an infection may be present.

**Body fluids** – Fluid produced by the body such as urine, faeces, vomit or diarrhoea.

**Blood Borne Viruses (BBV)** – Viruses carried or transmitted by blood, for example Hepatitis B, Hepatitis C and HIV.

**Carbapenemase Producing Enterobacteriaceae (CPE)** – A group of bacteria that have become extremely resistant to antibiotics including those called carbapenems.

**Care areas/environment** – Any place where care is carried out. This includes hospital wards, treatment rooms, care homes and care at home.
Care staff – Any person who cares for patients, including healthcare support workers and nurses.

Chlorine – A chemical that is used for disinfecting, fumigating and bleaching.

Cleaning – The removal of any dirt, blood, sickness, etc by use of an appropriate cleaning agent such as detergent.

Clinical setting – Any area where a patient is observed or treatment is carried out such as a treatment room or hospital ward.

Clinical wash hand basin – A sink designated for hand washing in clinical areas.

Clostridium difficile (C.diff) – An infectious agent (bacterium) that can cause mild to severe diarrhoea which in some cases can lead to gastrointestinal complications and death.

Cohorting – Placing a group of two or more patients (a cohort) with the same confirmed infection in the same room or area.

Cohort area – A bay or ward in which two or more patients (cohort) with the same confirmed infection are placed. A cohort area should be physically separate from other patients.

Cohort nursing – A dedicated team of healthcare staff who care for a cohort of patients, and do not care for any other patients.

Colonisation – The presence of bacteria on a body surface (such as the skin, mouth, intestines or airway) that does not cause disease in the person or signs of infection.

Conjunctivae – Mucous membranes that cover the front of the eyes and the inside of the eyelids.

Contact transmission – The spread of infectious agents from one person to another by contact. When spread occurs through skin-to-skin contact, this is called direct contact transmission. When spread occurs via a contaminated object, this is called indirect contact transmission.

Contaminated – May be visible e.g. dirty, soiled or stained or invisible e.g. microbial

Cross-infection/Cross-transmission – Spread of infection from one person to another.

Decontamination – Removing, or killing pathogens on an item or surface to make it safe for handling, re-use or disposal by cleaning, disinfection and/or sterilisation.
Detergent – A chemical cleansing agent that can dissolve oils and remove dirt.

Diarrhoea – 3 or more loose or liquid bowel movements in 24 hours or more often than is normal for the individual.

Direct contact transmission – Spread of infectious agents from one person to another by direct skin-to-skin contact.

Disinfectant – A cleaning chemical used to remove infectious agents from objects and surfaces.

Disinfection – A process, for example using a chemical disinfectant, to reduce the number of infectious agents from an object or surface to a level that means they are not harmful to your health.

Domestic waste – Waste produced in the care setting that is similar to waste produced in the home.

Droplet – A small drop of moisture, larger than airborne particle, that may contain infectious agents. Droplets can be released when a person talks, coughs or sneezes, and during some medical or patient care procedures such as open suctioning and cough induction by chest physiotherapy. It is thought that droplets can travel around 1 metre (3 feet).

Droplet transmission – The spread of infection from one person to another by droplets containing infectious agents.

En-suite – A room containing a sink and toilet and sometimes a shower/wetroom or bath.

Excretions – Waste products produced by the body such as urine and faeces (bowel movements).

Exposure – The condition of being exposed to something that may have a harmful effect such as an infectious agent.

Exposure Prone Procedures (EPPs) – Certain medical and patient care procedures where there is a risk that injury to the healthcare worker may result in exposure of the patient’s open tissues to the healthcare worker’s blood e.g the healthcare worker’s gloved hands are in contact with sharp instruments, needle tips or sharp tissues inside a patient’s body.

Fit testing – a method of checking that a tight-fitting facepiece respirator fits the wearer and seals adequately to their face. This process helps identify unsuitable facepieces that should not be used.

FFP3 – Respiratory protection that is worn over the nose and mouth designed to protect the wearer from inhaling hazardous substances, including airborne particles (aerosols). FFP stands for filtering facepiece. There are three categories of FFP respirator: FFP1, FFP2 and FFP3. An
FFP3 respirator or hood provides the highest level of protection, and is the only category of respirator legislated for use in UK healthcare settings.

**Fluid repellent** – Does not absorb liquid.

**Hand Hygiene** – The process of cleaning your hands by using either alcohol based hand rub or liquid soap and water.

**Health Protection Team (HPT)** – A team of healthcare professionals whose role it is to protect the health of the local population and limit the risk of them becoming exposed to infection and environmental dangers.

**Healthcare Associated Infection (HCAI)** – Infections that occur as a result of medical care, or treatment, in any healthcare setting.

**Healthcare Waste** – Waste produced as a result of healthcare activities for example soiled dressings, sharps.

**Hygiene Waste** – Waste that is produced from personal care. In care settings this includes feminine hygiene products, incontinence products and nappies, catheter and stoma bags. Hygiene waste may cause offence due to the presence of recognisable healthcare waste items or body fluids. It is usually assumed that hygiene waste is not hazardous or infectious.

**Hypochlorite** – A chlorine-based disinfectant such as bleach.

**Immunisation** – To provide immunity to a disease by giving a vaccination.

**Immunocompromised patient/individual** – Any person whose immune response is reduced or deficient, usually because they have a disease or are undergoing treatment. People who are immunocompromised are more vulnerable to infection.

**Impervious** – Cannot be penetrated by liquid.

**Indirect contact transmission** – The spread of infectious agents from one person to another via a contaminated object.

**Infection** – Invasion of the body by a harmful organism or infectious agent such as a virus, parasite or bacterium.

**Infectious agent** – Any organism, such as a virus, parasite, or bacterium, that is capable of invading body tissues, multiplying, and causing disease.

**Invasive device** – A device which penetrates the body, either through a body cavity or through the surface of the body. Central Venous Catheters (central line), Peripheral Arterial Lines and Urinary Catheters are examples of invasive devices.
**Invasive procedure** – A medical/healthcare procedure that penetrates or breaks the skin or enters a body cavity.

**Isolation** – Physically separating patients to prevent the spread of infection.

**Isolation suite/room** – An isolation suite comprises a single-bed room, en-suite facilities and a ventilated entry lobby.

**Microorganism (microbe)** – Any living thing (organism) that is too small to be seen by the naked eye. Bacteria, viruses and some parasites are microorganisms.

**Mode of transmission** – The way that microorganisms spread from one person to another. The main modes or routes of transmission are airborne (aerosol) transmission, droplet transmission and contact transmission.

**MRSA** – Strains of the infectious agent (bacterium) *Staphylococcus aureus* that are resistant to many of the antibiotics commonly used to treat infections.

**Mucous membranes/mucosa** – The surfaces lining the cavities of the body that are exposed to the environment such as the lining of the mouth and nose.

**Needle safety device** – Any device designed to reduce the risk of injury from needles. This may include needle-free devices or mechanisms on a needle, such as an automated resheathing device, that cover the needle immediately after use.

**Nitrile** – A synthetic rubber material used to make non-latex gloves.

**Non-sterile procedure** – Care procedure that does not need to be undertaken in conditions that are free from bacteria or other microorganisms.

**Occupational exposure** – Exposure of healthcare workers or care staff to blood or body fluids in the course of their work.

**Organism** – Any living thing that can grow and reproduce, such as a plant, animal, fungus or bacterium.

**Outbreak** – When there are two or more linked cases of the same confirmed infection or illness or when there are more cases than the number expected.

**Pathogen** – Any disease-producing infectious agent.

**Percutaneous injury** – An injury caused by a sharp instrument or object such as a needle or scalpel, cutting or puncturing the skin.
**Personal Protective Equipment (PPE)** – Equipment a person wears to protect themselves from risks to their health or safety, including exposure to infections e.g. disposable gloves and disposable aprons.

**Respiratory droplets** – A small droplet, such as a particle of moisture released from the mouth during coughing, sneezing, or speaking.

**Respiratory Protective Equipment (RPE)** – There are two main types of RPE: respirators and breathing apparatus. Respirators are devices worn over the nose and mouth or head and are designed to filter the air breathed in to protect the wearer from inhaling hazardous substances, including airborne particles (aerosols). Breathing apparatus provides a supply of breathing quality air from an external source such as a cylinder or an air compressor. The most commonly used item of RPE in healthcare settings is an FFP3 respirator.

**Re-sheath** – To put a needle or other sharp object back into its plastic sheath.

**Sanitary fittings** – Pieces of furniture that are in a bathroom, such as a toilet, bath etc.

**Secretions** – Any body fluid that is produced by a cell or gland such as saliva or mucous.

**Segregated** – Physically separating or isolating from other people.

**Sharps** – Sharp instruments used in healthcare settings such as needles, lancets and scalpels.

**Sharps injury** – See percutaneous injury.

**Spore** – A form that some types of bacteria take under certain environmental conditions. Spores can survive for long periods of time and are very resistant to heat, drying and chemicals.

**Sterile** – Free from live bacteria or other microorganisms.

**Sterile procedure** – Care procedure that is undertaken in conditions that are free from bacteria or other microorganisms.

**Sterilisation** – The procedure of making some object free of all germs, live bacteria or other microorganisms (usually by heat or chemical means).

**Surgical face mask** – A disposable fluid repellent mask worn over the nose and mouth to protect the mucous membranes of the wearer’s nose and mouth from splashes and infectious droplets and also to protect patients.
**Swan-neck** – Way of closing bag by tying in a loop and securing with a zip tie to make a handle.

**Terminal decontamination** – Cleaning/decontamination of an area or room following transfer/discharge of patient or when they are no longer considered infectious to ensure the area safe for the next patient or for the person to go back into their room in a care home setting.
5. Appendices

Appendix 1: How to hand wash step by step images

Steps 3 – 8 should take at least 15 seconds

Adapted from the World Health Organization
Appendix 2: How to hand rub step by step images

**How to handrub?**

*Steps 2 – 7 should take at least 15 seconds*

Duration of the entire procedure: 20-30 sec.

1. **Apply a pinchful of the product in a cupped hand and cover all surfaces.**
2. **Rub hands palm to palm.**
3. **Right palm over left dorsum with interlaced fingers and vice versa.**
4. **Palm to palm with fingers interlaced.**
5. **Backs of fingers to opposing palms with fingers interlocked.**
6. **Rotational rubbing of left thumb clasped in right palm and vice versa.**
7. **Rotational rubbing, backwards and forwards with clasped fingers of right hand in left palm and vice versa.**
8. **...once dry, your hands are safe.**

Adapted from the World Health Organization
Appendix 3: Glove use and selection
Appendix 4: Putting on and removing PPE

1. Putting on Personal Protective Equipment (PPE)
   - Platform hand fragrant, either putting on PPE.
   - Don over hand and knee, a lack of skin.

2. Removing Personal Protective Equipment (PPE)
   - Carefully remove gloves using the opposite hand.
   - Hold the removed glove in the gloved hand and pass the contaminated gloved hand through it.
   - Place the contaminated glove over the hand in the opposite hand and remove it.
Appendix 5: Routine decontamination of reusable non-invasive patient care equipment

- Check manufacturers instructions for suitability of cleaning products especially when dealing with electronic equipment.
- Wear appropriate PPE e.g disposable, non-sterile gloves and aprons.

**Yes**

- Is equipment contaminated with blood?

**No**

- Is equipment contaminated with urine/vomits/secretions or has it been used on a patient with a known or suspected infection/colonisation?

**Yes**

- Immediately decontaminate equipment with disposable cloths/paper roll and a fresh solution of detergent, rinse, dry and follow with a disinfectant solution of 10,000 parts per million available chlorine (ppm avg) rinse and thoroughly dry.

**No**

- Decontaminate equipment with disposable cloths/paper towel and a fresh solution of general purpose detergent and water or detergent impregnated wipes.
  - Follow manufacturers instructions for dilution, application and contact time.

- Either decontaminate equipment with disposable cloths/paper roll and a fresh solution of detergent, rinse, dry and follow with a disinfectant solution of 1,000 parts per million available chlorine (ppm avg) rinse and thoroughly dry.
  - Or use a combined detergent/chlorine releasing solution with a concentration of 10,000 ppm avg rinse and thoroughly dry.
  - Follow manufacturers instructions for dilution, application and contact time.

- Clean the piece of equipment from the top or furthest away point.
- Discard disposable cloths/paper roll immediately into the healthcare waste receptacle.
- Discard detergent/disinfectant solution in the designated area.
- Clean, dry and store re-usable decontamination equipment.
- Remove and discard PPE.

³Locally agreed variations to chemicals/wipes may be in place, see Appendix 10.
Appendix 6: Management of blood and body fluid spillages

Blood and/or body fluid spillage

- Wear appropriate personal protective equipment (PPE) e.g. non-sterile disposable gloves/sprays

Is the spillage on soft furnishings?

No

- Is it a spill of blood or body fluid as specified in Box 1?

Yes

- Box up spillage/gross contamination using disposable paper towels
- If a urine spillage, a cleaning agent can be used
- Do not use a chlorine releasing agent directly on a urine spill

- Apply on-site releasing granules directly to the spill.
- If granules not available place disposable paper towels over spillage to absorb and contain it applying solution of 15,000 ppm available (A) chlorine solution
- Follow manufacturer's instructions on contact time or leave for 3 minutes
- Discard the gross contamination into a healthcare waste bag

Decontaminate area with a solution of 1,000 ppm available (A) chlorine solution or use a combined detergent/chlorine releasing solution with a concentration of 1,000 ppm A
- Follow manufacturer's instructions on contact time or leave for a minimum of 3 minutes

- Wash area with disposable paper towels and a solution of general purpose detergent and warm water
- Dry area or allow to air dry
- Discard paper towels and disposable PPE into a healthcare waste bag
- Perform hand hygiene

Box 1
- Cerebrospinal fluid
- Peritoneal fluid
- Pleural fluid
- Synovial fluid
- Amniotic fluid
- Semen
- Vaginal secretions
- Breast milk
- Any other body fluid with visible blood

Discuss with IPC and consider:
- If furnishings heavily contaminated you may have to discard it.
- If the furnishings can withstand a chlorine releasing solution then follow appropriate procedure for the type of spill.
- If it is not safe to clean with detergent alone then follow appropriate procedure.
- If it is not safe to clean with detergent then the item should be discarded.

PHE Factsheet

A common childhood infection lasting 2-3 days followed by the rash on the cheeks. In adults can be associated with arthralgia.

Non-infectious when the rash appears. If the patient has a chronic disease or is immunocompromised maintain precautions for the duration of illness or whilst patient is hospitalised.

Advice should be sought from an Infection Control/Disease/Public Health Physician or Consultant Microbiologist when this disease is identified or suspected in pregnancy.

<sup>c</sup> DH Guidelines
Footnotes

a. Risk assessment and risk prioritisation may be required for allocation of single room facilities/use of cohorting
b. A room at negative pressure to the surrounding areas or with a positive pressure lobby suitable for source isolation (Health Building Note 4 Supplement 1 In-patient accommodation: Options for choice Supplement 1: Isolation facilities in acute settings – Wales http://www.wales.nhs.uk/sites3/page.cfm?orgid=254&pid=64096 )
c. Fluid repellent surgical facemask for any situation where there may be splashing of body fluids to the face and for droplet precautions as indicated, those with evidence of immunity to vaccine preventable diseases may dispense with facemask use following risk assessment
d. Only diseases and syndromes listed in Schedule 1 (notifiable by a registered medical practitioner) are noted here, for laboratory notifiable (Schedule 2) and full list see http://www.wales.nhs.uk/sites3/page.cfm?orgid=457&pid=48544
e. Aerosol Generating Procedures (see glossary)
f. Seasonal influenza only, separate UK guidance is available for avian and pandemic influenza
g. Includes Vancomycin (Glycopeptide) resistant Enterococci (VRE, GRE), Extended Spectrum Beta-Lactamase (ESBL) producing organisms, see separate guidance for Carbapenemase Producing Enterobacteriaceae (CPE)
Appendix 9: Locally agreed variations

Name of Organisation:

________________

Note: all variations to the national model policy must be agreed and approved by the Infection Prevention and Control Committee or organisational equivalent.

10.1 Choice of environmental disinfectants

If the organisation has agreed an alternative to a disinfectant or combined detergent/disinfectant product to the standard 1000 ppm available chlorine this should be documented here:

<table>
